# Precipitation-Chemistry Data at Selected Sites in Northwestern Colorado, 1980–94

By Anthony J. Ranalli

## Abstract

The chemical content of precipitation was monitored during the period 1980–94 at three sites at altitudes above 2,400 meters near the Piceance Basin in northwestern Colorado. Daily precipitation volumes, specific conductance, pH (in this report pH is expressed as hydrogen-ion concentration), concentrations of major cations and anions, calculated charge balance between cations and anions, and summary statistics of chemical concentrations are tabulated. Sampling sites are plotted on a map of the area. Seasonal variabilities of major cation and anion concentrations are presented graphically.

## INTRODUCTION

Knowledge of the chemistry of precipitation is needed in the preparation of permit requests for new sources of emissions to the atmosphere and for review of these requests. One area in which data may be needed is northwestern Colorado. Energy resources, such as oil shale and coal, are upwind from the federally protected Flat Tops Wilderness Area, which is sensitive to acid rain (Turk and Adams, 1983). The lack of precipitation-chemistry data in northwestern Colorado partially was addressed by establishment of a network of monitoring sites as part of a study done by the U.S. Geological Survey, in cooperation with Delta, Mesa, and Rio Blanco Counties, and assisted by the Rocky Mountain Oil and Gas Association. The network is located near the oil shale reserves of the Piceance Basin. Data collected from these sites provide a baseline for ambient atmospheric deposition that could be compared to any future measurements. The data also are suitable for making estimates of

natural variability in precipitation chemistry. This report presents data collected at the monitoring sites from 1980 to 1994 and includes site location, sampling and laboratory analytical methods, precipitation volume and summary statistics, and seasonal variability of major chemical constituents.

## Site Description

The three precipitation-monitoring sites (fig. 1) are located at Douglas Pass at an altitude of 2,710 meters in a treeless area of sage; at Grand Mesa, at an altitude of 3,121 meters in a clearing; and at Marvine Ranch, at an altitude of 2,414 meters in a clearing.

## Methods

Precipitation volume and chemistry have been monitored at Douglas Pass since November 1980, at Grand Mesa since August 1981, and at Marvine Ranch since April 1981. Data collection was discontinued at Douglas Pass and Grand Mesa in October 1991 but is ongoing at Marvine Ranch. The sampling equipment and analytical methods are the same at each site. The sampling intervals, however, varied at each site. The sampling equipment consisted of a Belfort weighing-bucket rain gage for the measurement of precipitation volume and an Aerochem Metrics Model 301 wet/dry collector for the monitoring of wet deposition. The samples collected at each site are a combination of single storms and two or more storms collected into a single sample. Unfiltered precipitation samples were analyzed for specific conductance, pH, dissolved calcium, magnesium, sodium, potassium, ammonium, chloride, nitrate, and sulfate by the U.S. Geological Survey National Water-Quality Laboratory in Arvada,

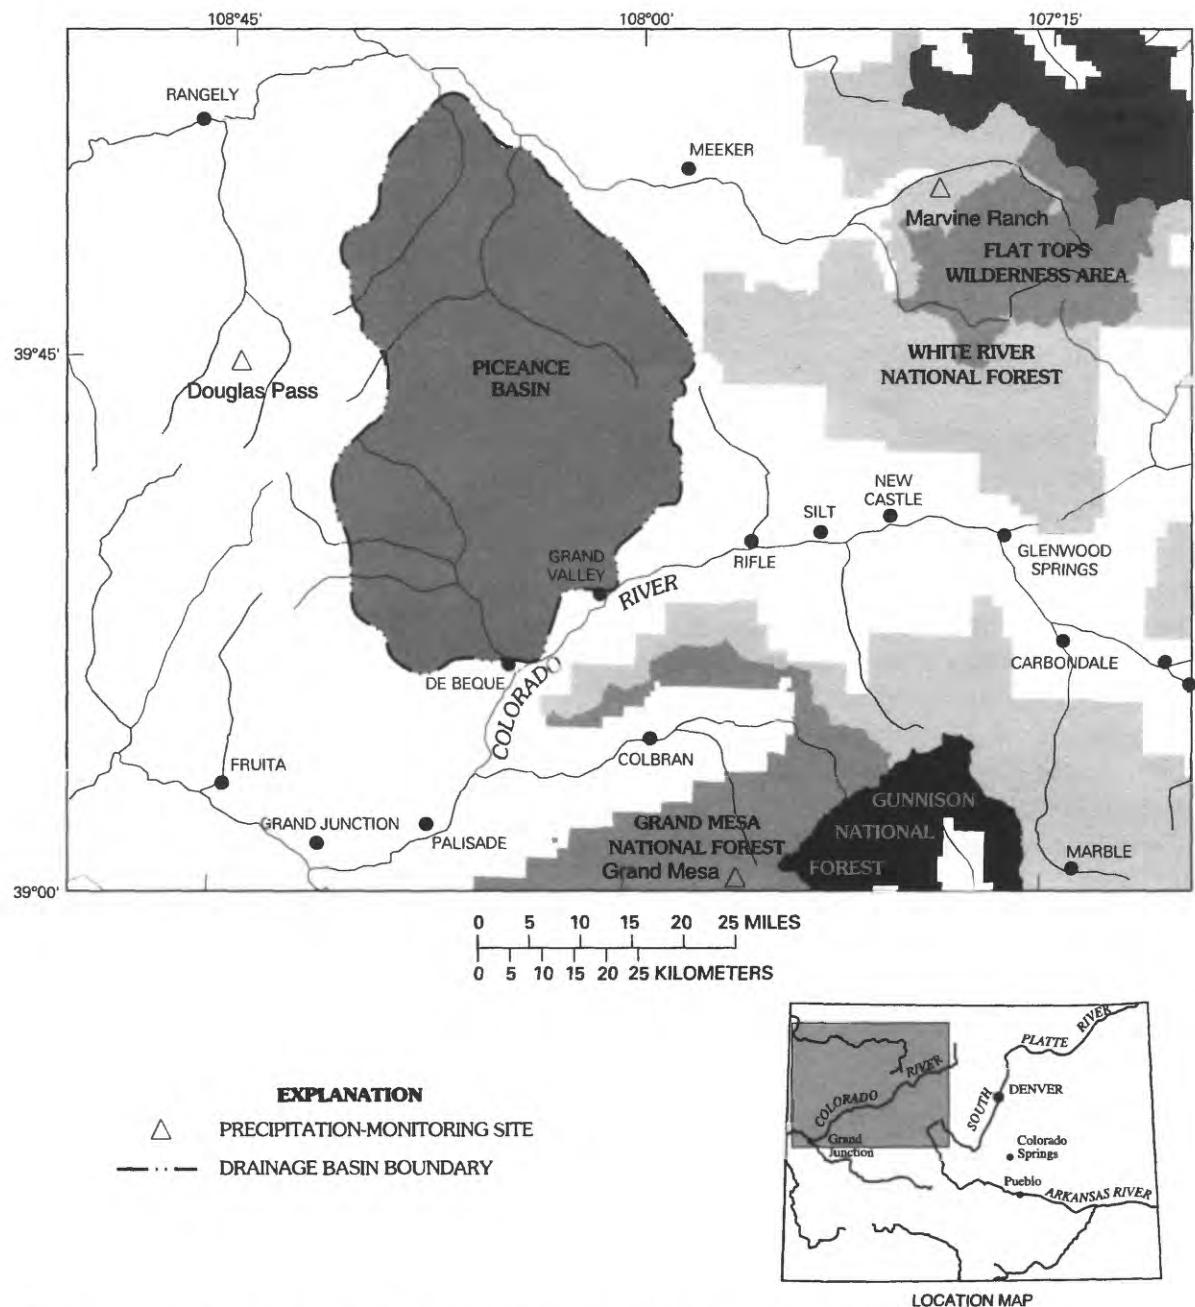

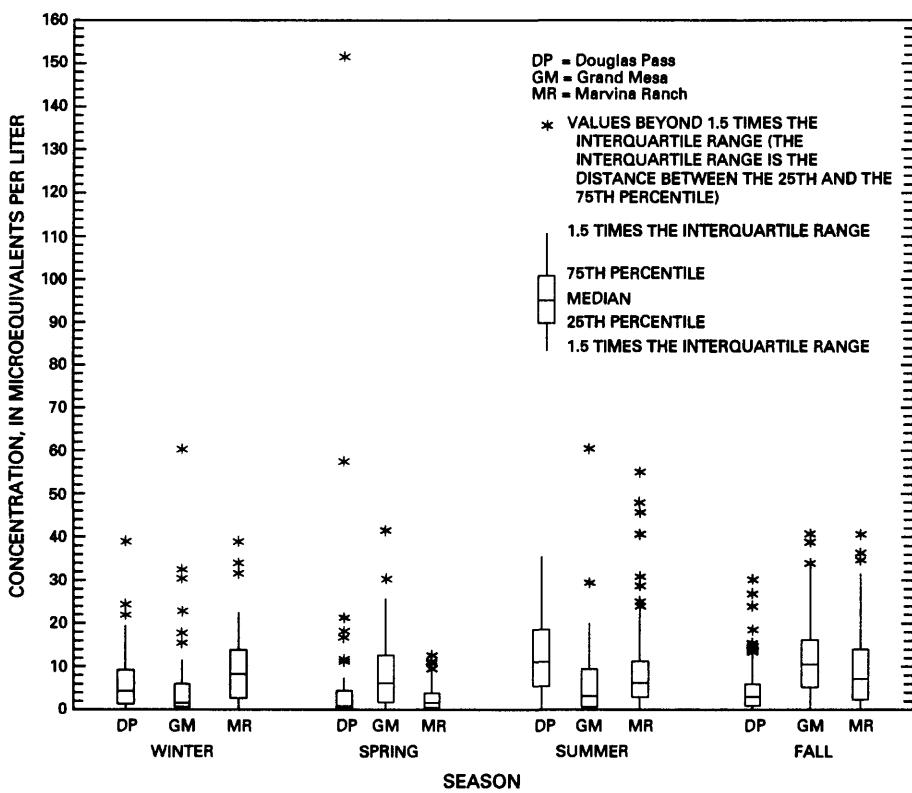

Figure 1. Location of selected precipitation-monitoring sites in northwestern Colorado.

Colorado, using methods described in Fishman and Friedman (1989). After May 1991, samples were filtered through 0.45-micrometer filters. Aliquots for cations were preserved with concentrated nitric acid, whereas aliquots for ammonium were preserved with mercuric chloride. The chemical data were checked using cation:anion balances and comparisons of measured and calculated specific conductance. Alkalinity was not measured because pH typically was low enough to make alkalinity minimal. The buckets used to collect precipitation were cleaned by scrubbing with a nylon brush and rinsing with deionized water. Bias and precision data for the chemical analysis done at the U.S. Geological Survey National Water-Quality Laboratory are published yearly in U.S. Geological Survey Water-Resources Investigations reports (Peart and Sutphin, 1987; Lucey

and Peart, 1988; Lucey and Peart, 1989a, 1989b, 1989c; Maloney and others 1992, 1993, 1994).

## RESULTS OF PRECIPITATION VOLUMES AND CHEMICAL CONCENTRATIONS

Specific conductance, precipitation chemical concentrations, and calculated charge balance are presented in tables 1, 3, and 5. Daily precipitation volumes are reported in tables 7–9. Summary statistics (tables 2, 4, and 6) of specific conductance and chemical concentrations (means, medians, standard deviations, and minimum and maximum values) follow each data table. Seasonal variations of precipitation chemistry at each site are shown in the box plots in figures 2–10.

<sup>1</sup>Values of pH can be calculated from hydrogen concentration by multiplying the log of the product of hydrogen concentration times  $1 \times 10^{-6}$  by -1.

**Table 4.** Summary statistics of specific conductance and concentrations of dissolved ions at Grand Mesa, 1981–91

[Specific conductance in microsiemens per centimeter at 25 degrees Celsius; dissolved ions in microequivalents per liter]

	Specific conductance	Hydrogen ( $H^+$ )	Calcium ( $Ca^{2+}$ )	Magnesium ( $Mg^{2+}$ )	Sodium ( $Na^+$ )	Potassium ( $K^+$ )	Ammonium ( $NH_4^+$ )	Chloride ( $Cl^-$ )	Nitrate ( $NO_3^-$ )	Sulfate ( $SO_4^{2-}$ )	
Number of samples	238	238	223	222	223	211	171	233	223	233	
Mean	9.1	7.6	24.7	4.3	5.4	1.8	12.5	5.1	15.3	20.1	
Median	7.4	5.2	13.5	3.3	0.43	1.0	10.0	3.4	12.7	16.4	
Standard deviation	7.1	8.4	56.8	4.3	4.7	4.8	15.3	7.2	12.4	15.1	
Minimum	1.3	0.1	0.2	0.4	0.2	0.1	0.7	0.1	0.6	0.8	
Maximum	60.6	60.3	798.4	26.3	33.1	58.8	157.1	91.1	124.8	119.7	

**Table 5.** Precipitation volume, specific conductance, concentrations of dissolved ions, and percent charge balance for each sampling interval at Marvine Ranch, 1981–94
